

MTBF

MTBF (mean time between failures) is calculated theoretically in this document using the following formula:

$$\frac{\text{Number of delivered modules in the period} * \text{number of days in the period}}{\text{number of returned units with proven errors} * 365} = \text{Years}$$

Module: 5333

Period: 01.07.2004 – 30.06.2005

Calculated MTBF: 5465 Years
